a phase record x_k
one subsequence, length $L = 4m$
(slides over all $N - 4m + 1$ positions)
b half-mean slope removal, then 3x time-reverse extension (length 3L)
reversed copy
window, slope removed
reversed copy
c modified Hadamard: Δ^3 at lag m, averaged over m, squared, $\div 6m^2\tau^2$
third differences $\Delta^3_m x_j^*$ along the extension (gray); one block of m = 3 averaged (amber)
